Structure

1 Introduction

What is Beamer?

The beamer classes for \LaTeX are used to create presentations that are to be shown with a beamer. The text typesetting system creates PDF files that can be shown by a large number of programmes. The present theme was adapted from HSRM theme by Benjamin Weiss and it makes the creation of slides (assuming basic knowledge of \LaTeX) child's play.

System requirements

In order to successfully create presentations with this theme, the following requirements must be met by the system:

- LuaLaTeX must be used to typeset the slides.
- Besides some standard packages, the packages beamer, pgf and xcolor must be installed.
- The fonts Flama-Light, Flama-Book and Flama-Medium should be installed. Alternative: Arial
